Prevalence, pre- and post-natal diagnosis, and infant mortality of newborns with congenital heart defects
A population-based study using the International Paediatric and Congenital Cardiac Code (IPCCC)
The EPICARD Study Group 2005-08

Proportion of prenatal diagnosis

All CHDs

ACC-CHD categories	% of prenatal diagnosis
All cases excluding chromosomal anomalies	25.6
All cases excluding chromosomal and other extra cardiac anomalies	23
All cases excluding chromosomal, other anomalies and simple VSD	40.2

In categories of CHDs

ACC-CHD categories	% of prenatal diagnosis (n)
Heterotaxy	89.2 (37)
Anomalies of venous connections	16.0 (25)
Anomalies of atria	4.3 (164)
Anomalies of AV junction and AV valves	67.0 (91)
Complex anomalies of AV junction	100.0 (13)
Functionally univentricular heart	92.5 (133)
Ventricular septal defects	9.6 (1353)
Anomalies of ventriculo-arterial connections	39.2 (503)
Anomalies of extra pericardial trunks	44.7 (143)
Congenital anomalies of coronary arteries	0 (9)

Specific CHDs

Type of CHD	% of prenatal diagnosis
Congenitally corrected transposition of the great	100
Functionally univentricular heart	92.5
TGA	74
DORV	98

Prenatal diagnosis of CHD and TERMINATION OF PREGNANCY

What is the impact ?

Prevalence, pre- and post-natal diagnosis, and infant mortality of newborns with congenital heart defects:
A population-based study using the International Paediatric and Congenital Cardiac Code (IPCCC)
The EPICARD Study Group 2005-08

Proportion of Termination of pregnancy

All CHDs

ACC-CHD categories	% TOP
All cases excluding chromosomal anomalies	9.8
All cases excluding chromosomal and other extra cardiac anomalies	6.4
All cases excluding chromosomal, other anomalies and simple VSD	14.0

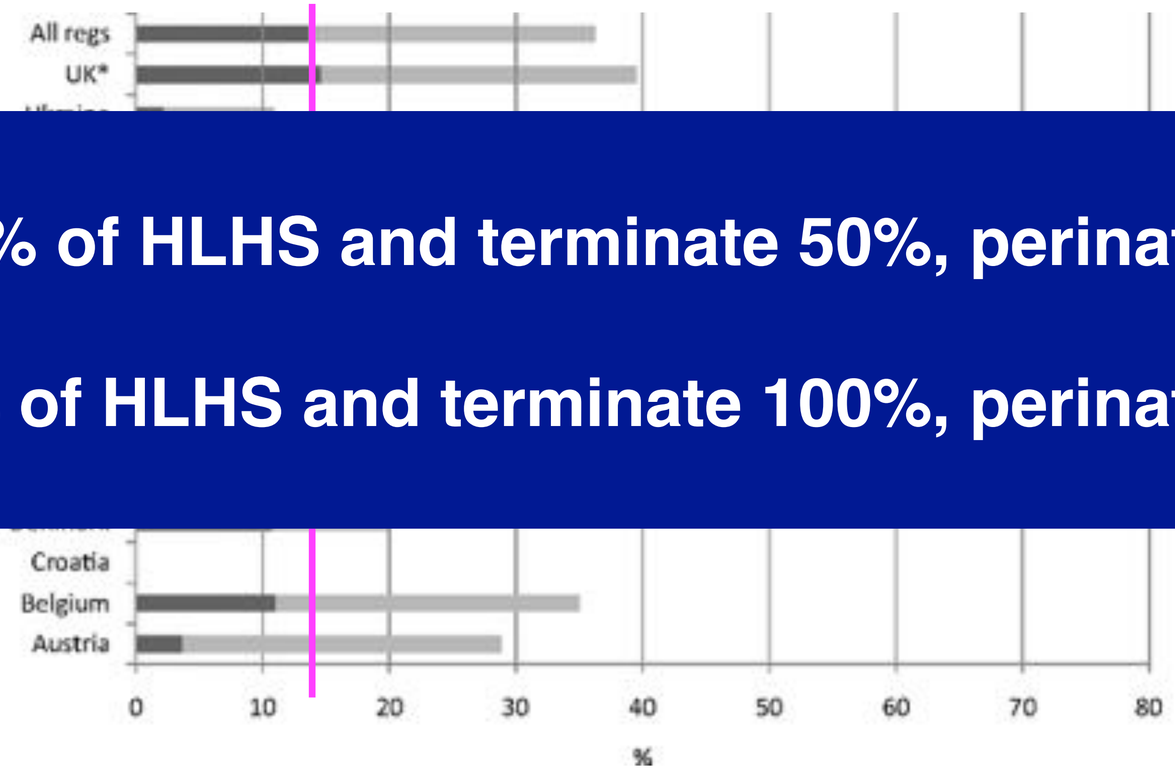
In categories of CHDs

ACC-CHD categories	% TOP
Heterotaxy	75.7
Anomalies of venous connections	16.1
Anomalies of atria	4.4
Anomalies of AV junction and AV valves	42.7
Complex anomalies of AV junction	46.2
Functionally univentricular heart	62.7
Ventricular septal defects	5.7
Anomalies of ventriculo-arterial connections	18.5
Anomalies of extra pericardial trunks	23.5
Congenital anomalies of coronary arteries	0

M3C

Khosnood B et al. Heart 2012;98:1667-73

Proportion of nonchromosomal SI/SII congenital heart defect cases prenatally diagnosed (PD)* by pregnancy outcome (terminations of pregnancy for fetal anomaly [TOPFA] or birth), by country, 2000 to 2005



If you diagnose 100% of HLHS and terminate 50%, perinatal mortality is 50%

If you diagnose 20% of HLHS and terminate 100%, perinatal mortality is 20%

Severity I (SI): single ventricle, hypoplastic left heart, hypoplastic right heart, Ebstein anomaly, and tricuspid atresia
Severity II (SII): pulmonary valve atresia, common arterial truncus, atrioventricular septal defects, aortic valve atresia/stenosis, transposition of great vessels, tetralogy of Fallot, total anomalous pulmonary venous return, and coarctation of aorta, without additional CHD subgroups classified as severity I.
Severity III (SIII): ventricular septal defect (VSD), atrial septal defect, and pulmonary valve stenosis, without additional CHD subgroups classified as SI or SII.

American Heart Association.

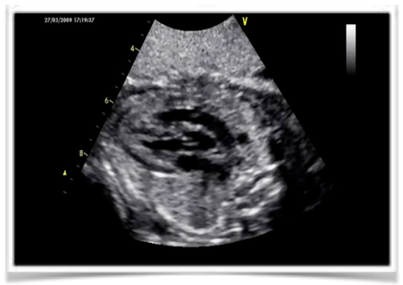
Prenatal diagnosis of CHD and MORTALITY

Is there any impact ?

Prenatal diagnosis of TGA reduces neonatal mortality

TGA



Preoperative mortality in TGA = 4-6%
(*vs./+)* Surgical mortality = 1-2%

Comparison of Characteristics of Patients in the Prenatal and Postnatal Groups

	Postnatal Group	Prenatal Group	*P*
Isolated TGA	304	57	NS
Associated defects	48	11	NS
VSD	31	5	NS
VSD + CoA	14	3	NS
CoA	1	1	NS
Age at admission, h	75 ± 210	2.2 ± 3.8	<0.01
Mechanical ventilation	95 (28)	13 (17.8)	<0.01
Metabolic acidosis + MOF	56	6	<0.05
PGE_1 infusion	95	32	NS
BAS	168	54	NS
Preoperative mortality	15	0	<0.05
Coronary artery pattern	233 (68)	49 (65)	
Normal	168	47	NS
Abnormal	65	26	NS
Preoperative mortality	30	0	<0.01
Hospital stay, d	30 ± 17	24 ± 11	<0.01

VSD indicates ventricular septal defect; CoA, coarctation; MOF, multiorgan failure; PGE_1, prostaglandin E_1; BAS, balloon atrioseptostomy; and ASO, arterial switch operation. Values are n (%).

Bonnet D et al. Circulation 1997
van Velzen CL et al. Ultrasound Obstet Gynecol 2015

Recent studies show that prenatal diagnosis DOES NOT impact neonatal CHD mortality

Table 3 Association between prenatal diagnosis and risk of infant mortality for four specific congenital heart defects (CHDs), EPIdémiologie des CARDiopathies congénitales (EPICARD) Population-Based Cohort Study

	Prenatal diagnosis		Infant mortality				
CHD		n*	n†	%	95% CI	Risk ratio	95% CI
Functionally univentricular heart‡	No	7	3	42.9	9.9 to 81.6		
	Yes	32	17	53.1	34.7 to 70.9	1.2	0.5 to 3.1
d-Transposition of the great arteries‡	No	24	1	4.2	0.1 to 21.1		
	Yes	57	5	8.8	2.9 to 19.3	2.1	0.3 to 17.1
Tetralogy of Fallot‡	No	18	2	11.1	1.4 to 34.7		
	Yes	36	1	2.8	0.07 to 14.5	0.3	0.02 to 2.6
Coarctation of the aorta‡	No	44	3	6.8	1.4 to 18.7		
	Yes	29	2	6.9	0.8 to 22.8	1.0	0.2 to 5.7

*N = number of live births (denominator data).
†n= number of deaths (numerator data).
‡Cases with the specific International Paediatric and Congenital Cardiac Code for the given CHD; whether or not other CHD codes were also included, all cases with chromosomal or others anomalies were excluded.

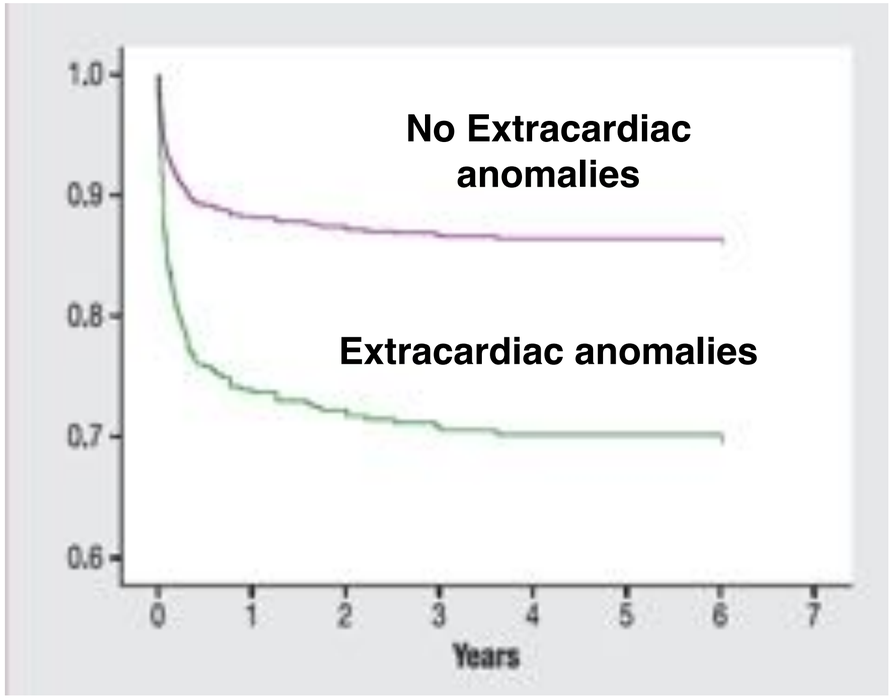
a priori at no risk of early intervention	7 (6.5)
ALL	**73 (6.7)**



Bensemlali M et al. CiTY 2016
Bensemlali M et al. Arch Cardiovasc Dis 2016

Mortality is no more the important outcome in developed countries

MORBIDITY (early and late) should be the new end-point to scrutinize

Mortality is not an end-point

Does prenatal diagnosis of CHD reduce neonatal morbidity?

- Prenatal diagnosis reduces morbidity in life-threatening CHD ?
  - Not reproducible in TGA[1] nor in other defects
- Prenatal diagnosis allows to anticipate and prevent early demise ?
  - Through immediate interventions[2] after *in utero* transfer of fetuses at risk

1-Escobar-Diaz M et al. Ultrasound Obstet Gynecol. 2015 ; 45: 678–682
2-Bensemlali M et al. CiTY 2016

Prenatal diagnosis anticipates and prevents early demise *is in utero transfer a valid option ?*

Common indications for in utero transfer

- **Life threatening CHDs**
  - ***Ex: TGA, TAPVR, HLHS***
- **Evolutive defects**
  - ***Ex: Coarctation of the aorta***
- **Uncertain perinatal physiology**
  - ***Ex: Tetralogy of Fallot***
- **Highly variable/unpredictable postnatal outcome**
  - ***Ex: Ebstein***

Interventions in prenatally diagnosed « in-born » CHD

Bensemlali M et al. CiTY 2016
Bensemlali M et al. Arch Cardiovasc Dis 2016

Mortality is not an end-point

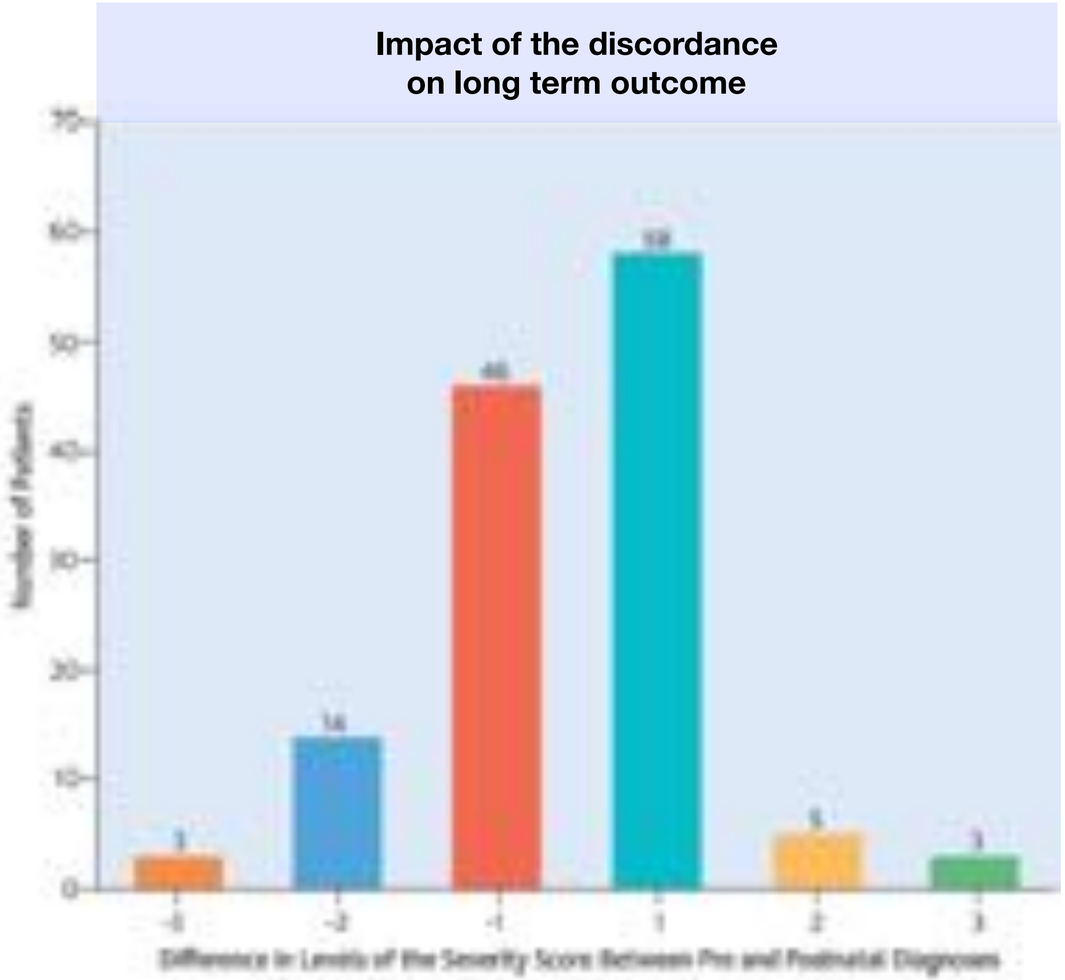
Does prenatal diagnosis of CHD reduce neonatal morbidity?

- Prenatal diagnosis reduces morbidity in life-threatening CHD ?
  - Not shown in TGA[1] nor in other defects
- Prenatal diagnosis allows to anticipate and prevent early demise ?
  - Through immediate interventions[2] after *in utero* transfer of fetuses at risk
  - Through *in utero* transfer to optimize diagnosis accuracy and tailor postnatal management

1-Escobar-Diaz M et al. Ultrasound Obstet Gynecol. 2015 ; 45: 678–682
2-Bensemlali M et al. CiTY 2016
3-Bensemlali M et al. JACC 2016

Impact of discordances between pre- and post-natal diagnosis on outcomes in in-born fetal CHD

Total number 1285	n	% of the total population	% of the discordances
Different diagnosis	36	2.9	9.8
Partially different diagnosis with MAJOR impact on the planned neonatal treatment	97	7.7	26.3
Partially different diagnosis with MINOR impact on the planned neonatal treatment	235	18.7	63.9



Bensemlali M et al. JACC 2016

Mortality is no more the important outcome in developed countries

Early morbidity reduction after prenatal diagnosis of CHD
is a valid end-point to be further confirmed
Indications for in utero transfer and prediction of early outcomes
should be further defined

Can late outcomes be predicted in fetal CHD ?

Prenatal diagnosis accuracy in predicting cardiac outcomes

- Prenatal diagnosis predicts cardiac mortality in live-birth prenatally diagnosed CHDs ?

  - Not shown in TGA[1] nor in other defects

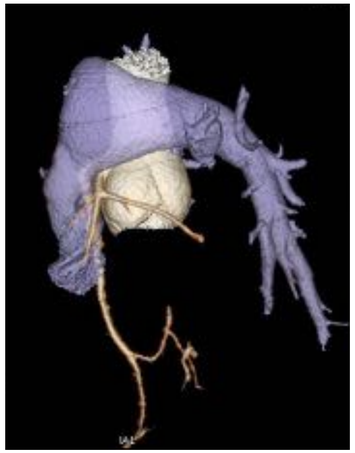
Is information on cardiac outcomes individualized ?

Mortality in simple TGA is mainly driven by coronary artery pattern
Should we attempt to diagnose coronary artery distribution before birth ?

1,7%

Single ostium

OR = 2.9



3,2%

Intramural course

OR = 6.5

If you claim that surgical mortality is 1% in simple TGA,

-you are close to reality in TGA with normal coronary pattern

-you are excessively optimistic in TGA with intramural course of coronary artery

Pasquali SK et al. Circulation. 2002;106:2575-80.

Prenatal diagnosis accuracy in predicting cardiac outcomes

- Prenatal diagnosis predicts cardiac mortality ?
  - Not shown in TGA nor in other defects
- Prenatal diagnosis predicts reparability of complex defects ?
  - Partially shown in PA-VSD and DORV

Is information on probability of complete repair individualized ?

Repair of PA-VSD is closely related to size of pulmonary artery branches

	Repair < 1y %	p
PA branches Normal vs. absent/hypoplastic	86 vs. 55	<0.001
PA trunk present vs. absent	79 vs. 16	0,003
MAPCAs present vs. absent	76 vs. 50	0.17

Kaguelidou F et al. Eur Heart J. 2008

Prenatal diagnosis accuracy in predicting cardiac outcomes

- Prenatal diagnosis predicts cardiac mortality ?
  - Not shown in TGA nor in other defects
- Prenatal diagnosis predicts reparability of complex defects ?
  - Partially shown in PA-VSD and DORV
- Interventions after prenatal diagnosis can modify cardiac outcomes
  - Partially shown in fetal aortic valve stenosis

Prenatal diagnosis accuracy in predicting NON-cardiac outcomes

- Prenatal diagnosis improves neurodevelopment outcomes ?
  - Shown in TGA[1]

Calderon J et al. J Pediatr 2012

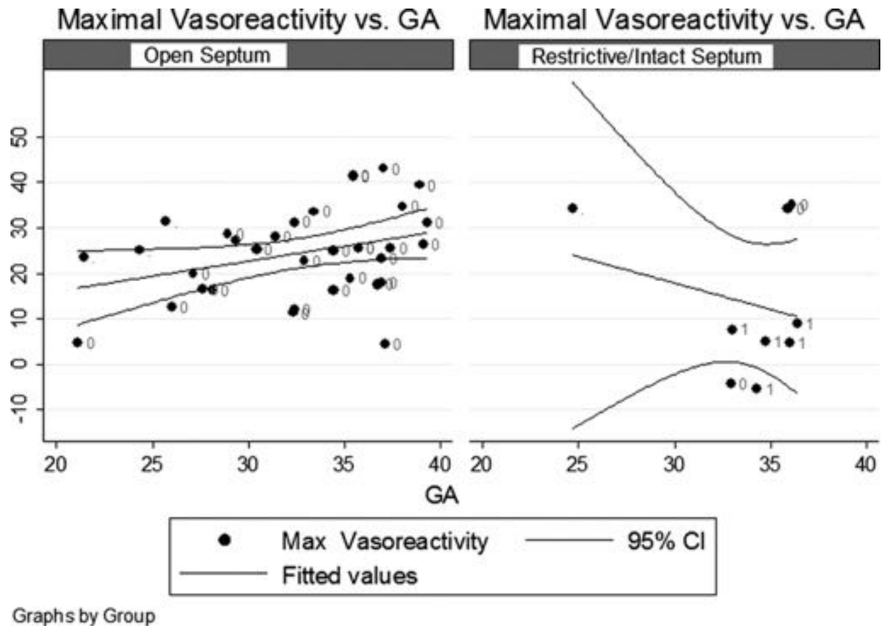
Neurodevelopmental morbidity is improved after prenatal diagnosis

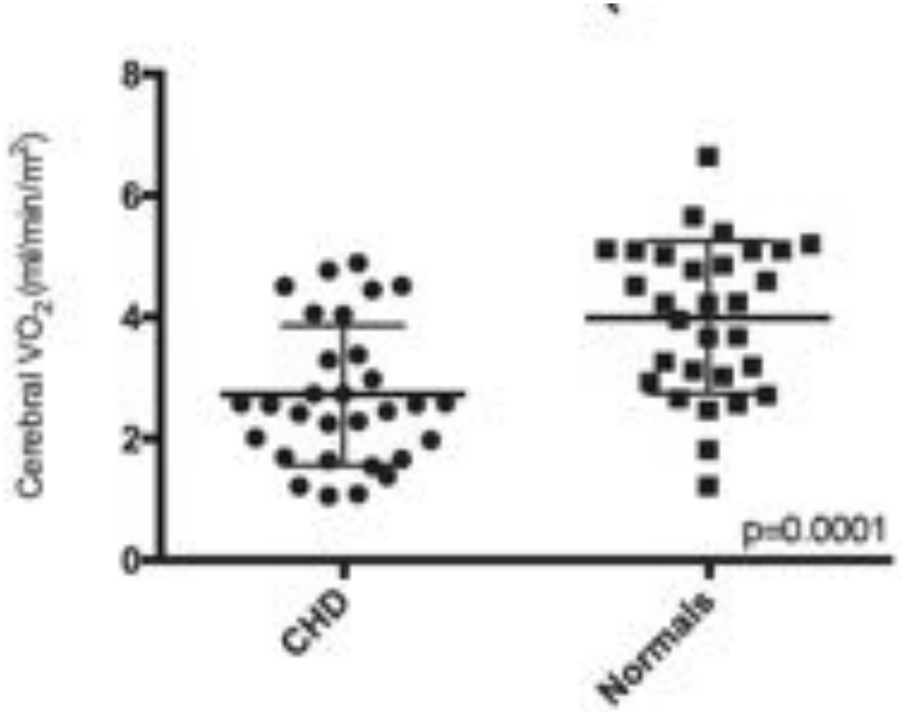
Cognitive Domain	Test	Prenatal (n=29)	Postnatal (n=16)	*p*
IQ	CMMS	114.5 (8.50)	112.4 (8.06)	0.4
Receptive Language	NEPSY - Comprehension	12.65 (0.55)	12.25 (1.12)	0.11
Response motor control	NEPSY – Knock and tap	24.31 (2.46)	24.14 (5.82)	0.89
Cognitive control	Stroop test (Number of errors)	2.41 (2.48)	4.31 (3.59)	0.04
	Stroop test (Reaction Time)	77.82 (28.05)	90.74 (36.71)	0.19
Verbal working memory	Digit span WISC IV	2.96 (2.48)	2.62 (2.57)	0.66
Spatial working memory	BEM-144 blocks	3.62 (2.0)	2.06 (2.01)	0.01
Cognitive flexibility	DCST	8.10 (2.65)	5.64 (2.61)	0.006
Social cognition	Theory of mind	1.31 (1.33)	0.31 (0.87)	0.01

Calderon J et al. J Pediatr 2012

Prenatal interventions can improve non-cardiac outcomes

Maternal interventions to improve outcome : hyperoxygenation





Pulsatility index and need for BAS in HLHS
Might improve LV filling in conditions leading to small LV
Hyperoxygenation may improve fetal brain VO2 and have an impact on white matter anomalies

Szwast A et al. Circ Cardiovasc Imaging 2010;3:172-178
Channing A et al. Ultrasound Obstet Gynecol 2015; 45: 664–669

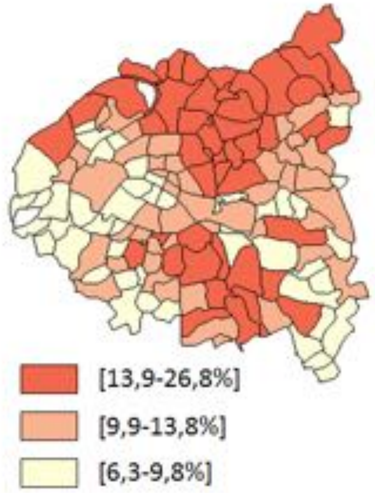
Prenatal diagnosis accuracy in predicting NON-cardiac outcomes

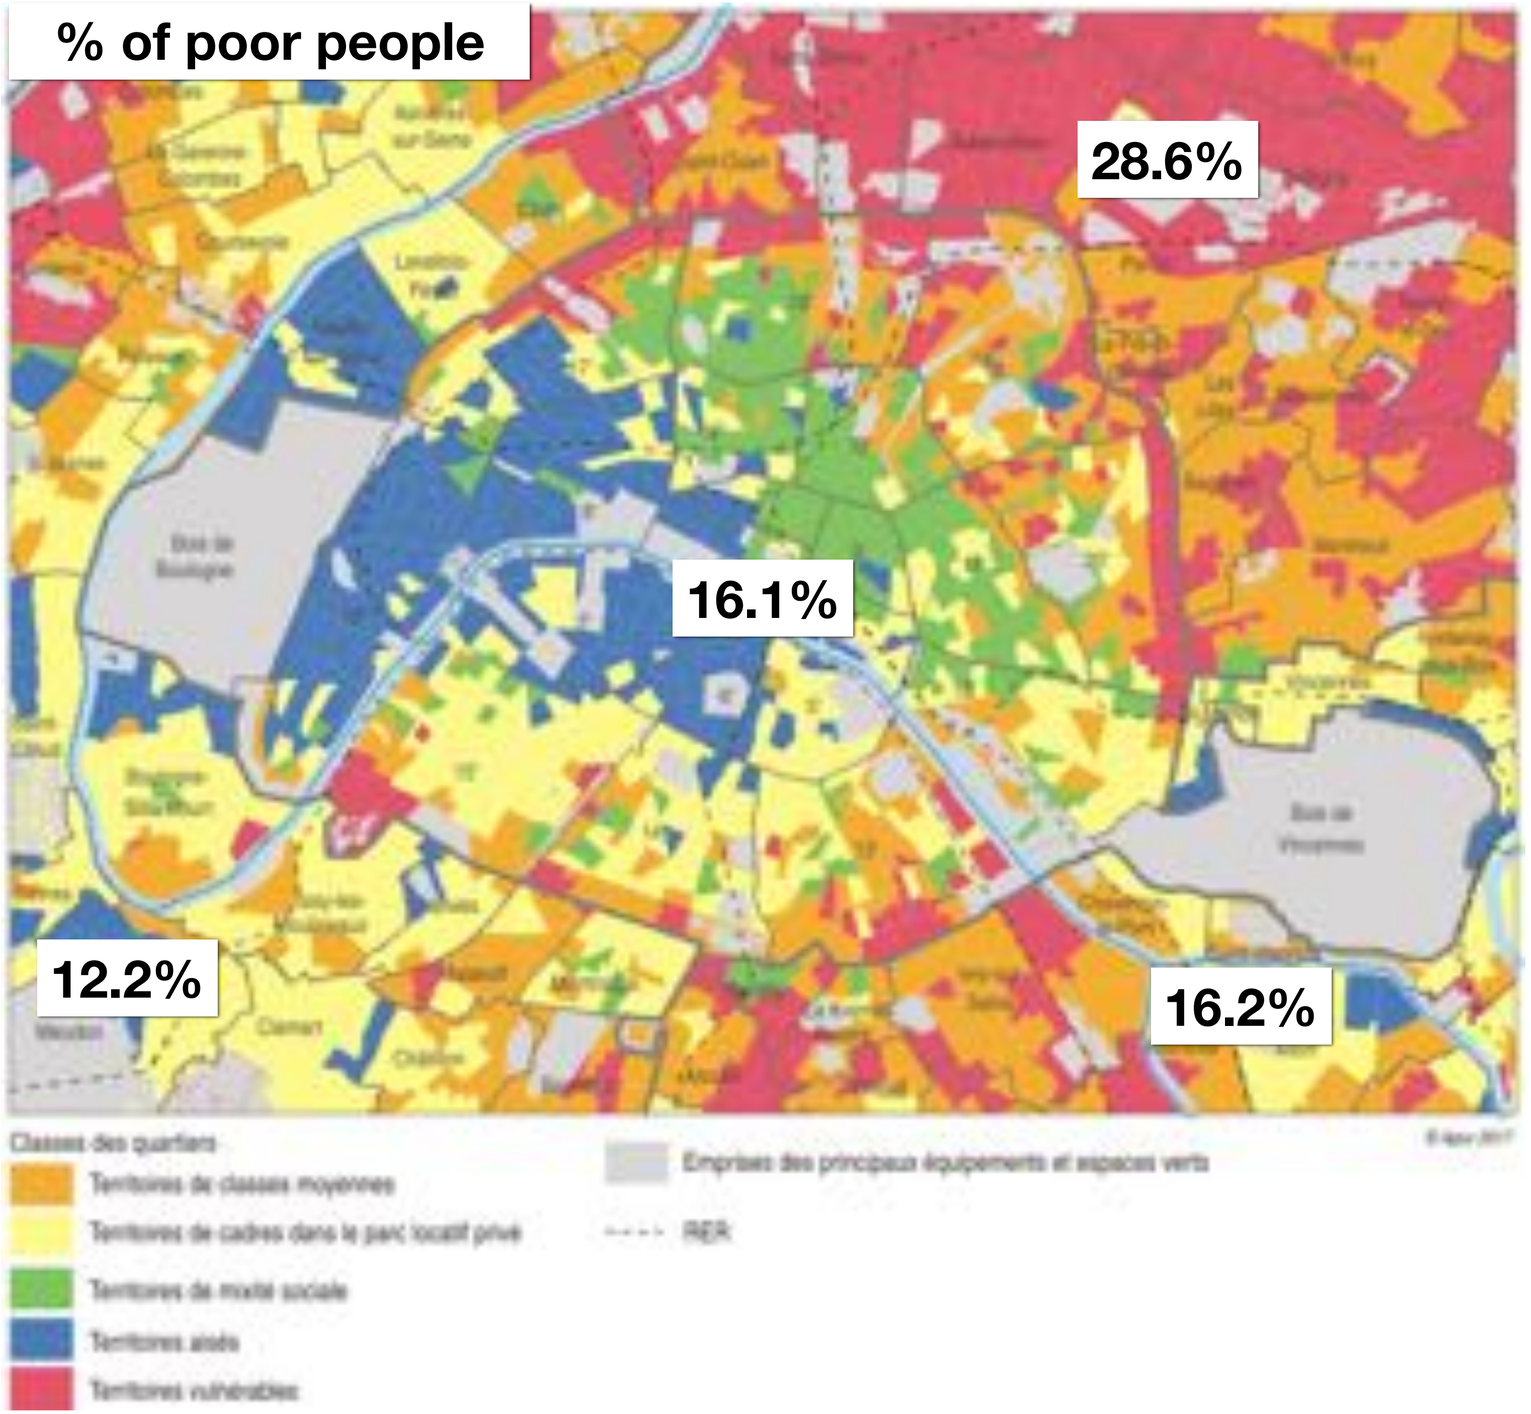
- Prenatal diagnosis improves neurodevelopmental outcomes ?
  - Shown in TGA[1]
- Prenatal diagnosis can help detecting social conditions at risk ?
  - Poverty is a major risk factor for poorer non-cardiac (and cardiac) outcomes

Calderon J et al. J Pediatr 2012
Khosnood B et al. 2017

Vulnerable areas

Schools, security, housing…





Socioeconomic disparities in healthcare are not inevitable
The EPICARD Study Group

Differences in prenatal diagnosis by maternal occupation, geographic origin and place of residence

The proportion of PND of CHD were similar across categories

- The health system organization allowed high availability of reimbursed specialized services that can provide similar access to PND for all socioeconomic groups

Income level and geographic origin does not influence access to prenatal diagnosis and postnatal care

Proportion of TOP is related to maternal origin

Khosnood B et al. 2017

How socioeconomic differences in prenatal decision for TOP may influence outcomes ?

- The probability of TOPFA may represent women's preferences that should of course be respected.
- These differences in TOPFA can result in disparities in the spectrum of severity of CHD at birth and thereby, all else equal, in the risk of mortality, morbidity and long-term adverse developmental outcomes for newborns with CHD.
- In addition, families with fewer resources may become disproportionately responsible for the care of newborns with more severe types of CHD.
- The extent to which post-natal management can modify any such disparities needs to be examined.

State of play

- Prenatal diagnosis has a specific organization in France with a high rate of detection for complex CHD.
- While access to prenatal diagnosis is possible for all women, the proportion of TOP is stable for 25 years with extracardiac anomalies and univentricular heart being the major causes for TOP.
- Diagnosis accuracy has still to be improved to better organize perinatal care and predict short and long term outcomes.
- The future is to improve cardiac and extra cardiac outcomes of prenatally diagnosed fetuses with CHD:
  - Identification of fetuses at high risk before and after birth
  - Fetal cardiac interventions
  - Maternal/social interventions for cardiac or neurodevelopment end-points
